

with CrossGlide inserter Standard and Mini size

#### INDICATION

Hormone free intrauterine contraception in women of childbearing age.

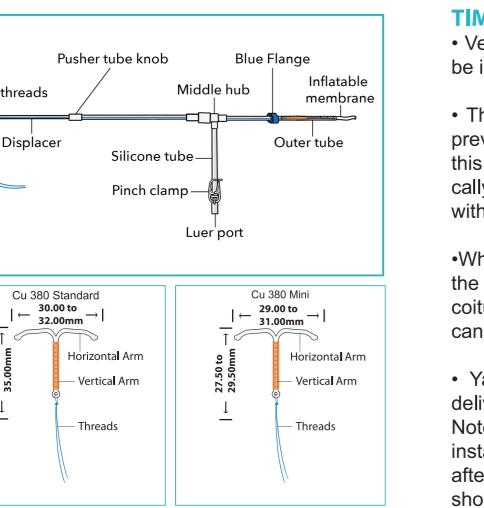

#### INTENDED USE

Yanae is a hormone free contraceptive for women of childbearing age. It offers an almost complete protection against pregnancy, having an effective period of 5 years. Yanae does not affect lactation. This is fully reversible method and protection is reversed on its removal.

**Yanae does not protect against Sexually transmitted diseases.**

#### COMPOSITION OF THE DEVICE

The device is composed of a Y-shape copper IUD and an inserter as described below.

#### UNDESIRABLE EFFECTS:

Adverse effects of intrauterine devices, including Yanae IUD, are low but include the following:

#### 1. Bleeding:

Menstrual bleeding is sometimes stronger and of longer duration than normal, or is more painful. Iron deficiency anaemia may then occur in individual cases. Slight intermenstrual bleeding, often in the form of spotting, may occur but usually subsides spontaneously.

#### 2. Pelvic Infection:

The risk of pelvic infection (salpingitis), usually requiring removal of the intrauterine device and appropriate antibiotic treatment, may occur and may lead to subsequent infertility. Randomized, controlled studies indicate that any risk of genital tract infection after the first month of IUD is low. Exposure to sexually transmitted infections (STIs), and not the use of IUD itself, is responsible for PID occurring after the first month of use.

#### 3. Pain or Dysmenorrhea:

Pain in the lower abdomen or sacral area may occur initially after insertion but usually subsides with time or with analgesic treatment. Pain may be a physiological response to the presence of the device, but the possibility of infection, improper positioning of the device (including perforation and migration), and pregnancy should be excluded. Delayed detection of perforation may lead to IUD migration outside the uterine cavity and/or injury to other adjacent organs, and unintended pregnancy.

#### 4. Other:

Certain women, in particular nulliparous women, are more susceptible to syncope, bradycardia and other neurovascular episodes during and immediately after insertion or removal of an intrauterine device. Isolated cases of skin reactions have been described in the literature which may be attributable to copper allergy.

#### TIMING OF INSERTION

• Verify that the user is not pregnant. The IUD must not be inserted if there is the possibility of pregnancy.

• The best time for insertion is during menstruation to prevent insertion during non-diagnosed pregnancy. At this time the external and internal cervical os is physiologically dilated. This facilitates the insertion of the IUD without the need to dilate the canal in most instances.

• When using the Yanae for emergency contraception, the IUD may be introduced within 5 days of unprotected coitus. Insertion immediately after unprotected coitus can increase the risk of PID.

• Yanae can also be inserted within 15 minutes of delivery of the placenta or abortion in the first trimester. Note that there is a higher rate of expulsion in these instances. If the Yanae cannot be inserted immediately after delivery of the placenta or abortion, insertion should be delayed for at least six weeks. In case of caesarean section insertion should be delayed for 12 weeks after delivery.

#### PREPARING THE USER

- Operator should wear sterile gloves and use aseptic technique.
- He/she should gently explain to the patient what he/she is doing.
- Perform an examination of the uterus to determine its position, form and size and the flexion of the uterine axis (manual or by echography)
- Prior to insertion, the vagina and cervix should be cleaned with sterile swab soaked in an antiseptic solution.

- The cervix should be visualised by means of speculum. The length of the cervical canal and endometrial cavity should be determined using a uterine sound.

#### PROCEDURE FOR INSERTION

Insertion of Yanae is a two-step procedure:

- Step 1 is the preparation of the device. It is an external procedure
- Step 2 is the insertion of IUD Yanae in the uterine cavity.

#### CAUTION

- Do not pick up any component that has fallen on the floor or table.
- Do not empty the contents of the pouch in the instrument tray.

#### STEP 1: PREPARATION OF THE DEVICE: LOADING THE IUD INTO THE INSERTER

##### 0. Measuring the uterine length

###### 1. Opening the pouch

- Place the package on clean and flat surface. For right-handed operator, place the pouch with the IUD facing left. For left-handed operator, place the pouch with the IUD facing right.

###### 2. Balloon inflation

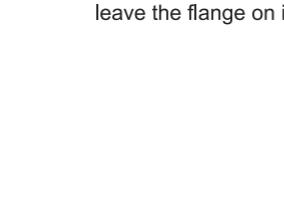

Lift inflation tube upward as shown in (Figure 1). Take the 3 CC syringe prefilled with saline in the ancillary pack.

When using the Yanae for emergency contraception, the IUD may be introduced within 5 days of unprotected coitus. Insertion immediately after unprotected coitus can increase the risk of PID.

Yanae can also be inserted within 15 minutes of delivery of the placenta or abortion in the first trimester. Note that there is a higher rate of expulsion in these instances. If the Yanae cannot be inserted immediately after delivery of the placenta or abortion, insertion should be delayed for at least six weeks. In case of caesarean section insertion should be delayed for 12 weeks after delivery.

#### PREPARING THE USER

- Operator should wear sterile gloves and use aseptic technique.
- He/she should gently explain to the patient what he/she is doing.
- Perform an examination of the uterus to determine its position, form and size and the flexion of the uterine axis (manual or by echography)
- Prior to insertion, the vagina and cervix should be cleaned with sterile swab soaked in an antiseptic solution.

Without moving the displacer, pull back the inserter by 1.5 cm. Then push the displacer to deploy the IUD into the uterine cavity.

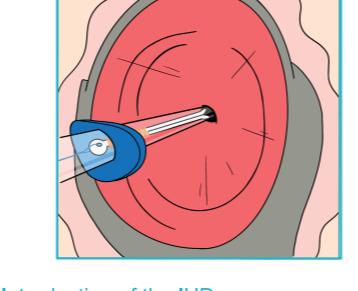

Without moving the displacer, pull back the inserter by 1.5 cm. Then push the displacer to deploy the IUD into the uterine cavity.

#### 3. Loading the IUD into the balloon

Grab the threads and hold the device firmly with the left hand (right-handed) or right hand (left-handed) at the middle hub and release both threads. Pull the IUD into the distal part of the inserter by pulling both threads (see Figure 3).

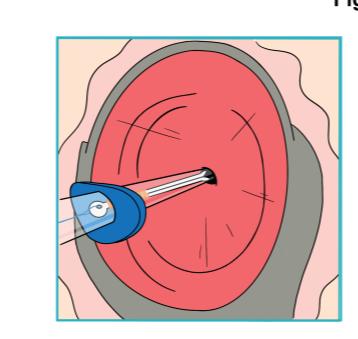

Figure 3

#### 1. Place the inserter at the external cervical os

With your non-dominant hand (left for right-handed, right for left-handed operator) grab the device at the middle hub and position it at the cervical opening as shown in (Figure 4).

Figure 4

#### 2. Introduction of the IUD

Use your dominant hand (right for right-handed, left for left-handed operator) and ADVANCE the pusher tube until it stops against the hub (Figure 6 yellow arrow).

Figure 6

#### 4. Final step before insertion procedure

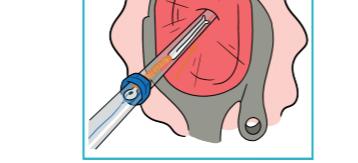

Peel the remaining cover of the package and remove the device while keeping it horizontal. Be careful not to dislodge the IUD by pushing the displacer forward. Do not let the device touch any unsterile surface that may contaminate it.

#### STEP 2: INSERTION OF THE IUD

##### 0. Preparation for inserter insertion into the uterus (optional)

If measurement of uterine cavity has been made, set the blue flange to uterine length. Otherwise, leave the flange on its current position.

Figure 7

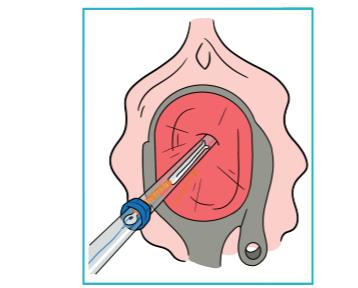

Without moving the displacer, pull back the inserter by 1.5 cm. Then push the displacer to deploy the IUD into the uterine cavity.

#### 5. End of the procedure

Then advance slowly the balloon until resistance is felt and you feel the fundus (Figure 7). Do not force forward the outer tube if resistance is felt

#### 3. Deployment of the IUD

Figure 7

Without moving the displacer, pull back the inserter by 1.5 cm. Then push the displacer to deploy the IUD into the uterine cavity.

#### STEP 4: Thoroughly apply an appropriate antiseptic (e.g., povidone iodine or chlorhexidine) two or more times to the cervix (wiping from inside the os outward) and vagina. If povidone iodine is used, ensure that the woman is not allergic to iodine and wait 2 minutes for the solution to act. Ask her to take slow, deep breaths and relax. Inform her that she may feel some discomfort and cramping, which is normal.

- If your period is delayed (with symptoms of pregnancy, such as nausea, tender breasts etc.) report immediately to the clinic.
- If there is abdominal pain, pain during intercourse, infection (such as gonorrhoea), abnormal discharge, fever, chills consult your physician.

- Yanae Intrauterine Contraceptive device doesn't interact with any medicine the woman may be taking.

Do not use force at any stage of this procedure. Grasp the threads of the IUD with a high-level disinfected (or sterile) straight artery forceps. Apply steady but gentle traction, gently pulling the threads toward you with the forceps. The device can usually be removed without difficulty. If the threads break off but the IUD is visible, grasp the device with the forceps and remove it. If removal is difficult, do not use excessive force.

#### MECHANISM OF ACTIONS

Yanae acts by greatly reducing the likelihood of fertilization. Data and analysis indicate that the main antifertility effect of copper bearing IUD's involve inhibition of egg or sperm transport and/or the capacity of sperm to fertilize egg.

#### DISPOSAL

On completion of shelf life or on removal after use dispose the item as per the local regulations governing disposal on non-recyclable waste / medical waste.

#### INCOMPATIBILITIES

- 1) An anatomical abnormality that distorts the uterine cavity might preclude proper IUD placement.
- 2) Incompatibility between the IUD and the uterine cavity can lead to partial or total expulsion, pain, unintended pregnancy, and abnormal or heavy uterine bleeding leading to removal of the device.

#### MRI COMPATIBILITY:

Radiotherapy or electrotherapy using high frequency current is contraindicated especially when it is applied in the area of the lower pelvis. With regard to use of the continuous low-frequency current (ionizations), it appears that it cannot have a harmful effect on women using a copper IUD. The energetic state of copper will not be modified by MRI, therefore the effect of MRI on IUD cannot be estimated. In addition, based on the non-ferric characteristic of copper, scintigraphy obtained by MRI is not considered to be impacted by the presence of the IUD.

#### 4. Wilson's disease

- 5. Anti-inflammatory treatment

- 6. Multiple exposures to different sexual partners

**WARNING & PRECAUTION**  
Prior to use inspect package for any visible damage or defect.

#### RISK OF RE-USE

- Loss of sterility & corresponding risk of infection.
- Loss of efficacy due to lesser copper than the designed specification.

#### DISPOSAL

On completion of shelf life or on removal after use dispose the item as per the local regulations governing disposal on non-recyclable waste / medical waste.

#### INCOMPATIBILITIES

- 1) An anatomical abnormality that distorts the uterine cavity might preclude proper IUD placement.
- 2) Incompatibility between the IUD and the uterine cavity can lead to partial or total expulsion, pain, unintended pregnancy, and abnormal or heavy uterine bleeding leading to removal of the device.

#### MRI COMPATIBILITY:

Radiotherapy or electrotherapy using high frequency current is contraindicated especially when it is applied in the area of the lower pelvis. With regard to use of the continuous low-frequency current (ionizations), it appears that it cannot have a harmful effect on women using a copper IUD. The energetic state of copper will not be modified by MRI, therefore the effect of MRI on IUD cannot be estimated. In addition, based on the non-ferric characteristic of copper, scintigraphy obtained by MRI is not considered to be impacted by the presence of the IUD.

The device is for single use only.

#### INDICATION

Dispositif contraceptif intra-utérin sans hormone indiqué chez les femmes en âge de procréer.

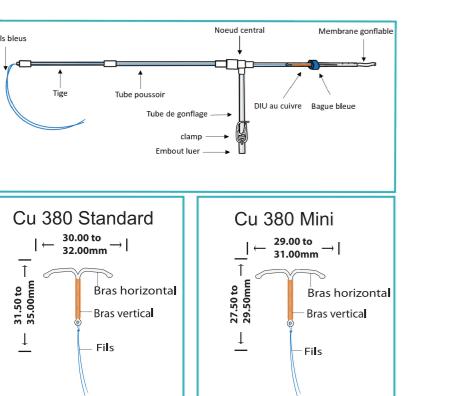

#### USAGE INDICUÉ

Yanae est un dispositif contraceptif sans hormone, destiné aux femmes en âge de procréer. Il offre une protection quasi complète contre les grossesses, et est efficace durant 5 ans. Yanae est sans effet sur la lactation. Cette méthode est totalement réversible et la protection est interrompue dès son retrait.

**Yanae ne protège pas des infections sexuellement transmissibles.**

#### COMPOSITION DU DISPOSITIF :

Comme décrit ci-dessous, le dispositif est composé d'un DIU en cuivre en forme de Y et d'un tube inserteur.

#### EFFETS INDESIRABLES :

Les effets indésirables des dispositifs intra-utérins, incluant Yanae, sont rares et sont les suivants :

##### 1. Saignements

Les règles peuvent parfois être plus importantes et d'une durée plus longue que la normale, ou peuvent être plus douloureuses. Une anémie peut survenir dans certains cas. De faibles saignements, de type spotting, peuvent avoir lieu entre les règles mais disparaissent généralement de façon spontanée.

##### 2. Infection pelvienne

Le risque d'infection pelvienne (salpingite), nécessitant le retrait du dispositif intra-utérin ainsi qu'un traitement antibiotique approprié, peut survenir et parfois conduire à une infertility. Des études cliniques contrôlées et randomisées ont montré que le risque d'infection du tractus génital après le premier mois d'utilisation du DIU est cependant faible.

L'exposition aux infections sexuellement transmissibles (IST), et non le DIU lui-même, est parfois responsable de MIP (maladies inflammatoires pelviennes) survenant après le premier mois d'utilisation.

#### 3. Douleurs et dysménorrhées

Des douleurs dans la partie basse de l'abdomen ou dans la région sacrée peuvent apparaître dans les heures ou les jours qui suivent l'insertion du DIU mais disparaissent généralement avec le temps ou avec la prise d'antalgiques. La douleur peut être physiologique mais elle peut aussi être liée à une infection, à un mauvais positionnement du dispositif (y compris une perforation ou une migration), ainsi qu'à une grossesse. Le retard de détection d'une perforation peut conduire à la migration du DIU en dehors de la cavité utérine et/ou à des dommages des organes adjacents ainsi qu'à une grossesse non désirée.

##### 4. Autres

Certaines femmes, en particulier les nullipares, sont plus sujettes à une syncope, bradycardie et autres épisodes neurovasculaires pendant ou immédiatement après l'insertion ou le retrait du dispositif intra-utérin. Des cas isolés de réactions cutanées ont été décrits dans la littérature et peuvent être associés à des allergies au cuivre.

#### ETAPES DE L'INSERTION

- Avant l'insertion, vérifier que la patiente n'est pas enceinte. Le DIU ne doit pas être inséré si il y a une possibilité de grossesse.
- La meilleure période pour l'insertion est celle des règles afin de prévenir le risque de grossesse méconnue. Durant cette période, les orifices cervicaux externe et interne sont ouverts ce qui facilite, dans la grande majorité des cas, l'insertion du DIU sans recours à une dilatation du col.
- Lorsque Yanae est utilisé pour une contraception d'urgence, le DIU doit être inséré dans les 5 jours suivant le rapport non protégé. L'insertion après un rapport sexuel non protégé pourrait augmenter le risque de MIP.

- Yanae peut également être inséré dans les 15 minutes suivant la délivrance du placenta ou après un avortement au cours du premier trimestre. Il est cependant à noter que le taux d'expulsion est plus important dans ces cas. Si Yanae ne peut pas être insérée immédiatement après la délivrance du placenta ou l'avortement, l'insertion doit être programmée au moins six semaines après. Dans les cas de césarienne, l'insertion doit être programmée 12 semaines après l'accouchement.

##### 2. Gonflage du ballonnet

Placez le tube de gonflage à la verticale comme illustré sur la Figure 1.

Se munir de la seringue de 3 ml pré-remplie de solution saline contenue dans la boîte.

Figure 1

#### PROCÉDURE D'INSERTION

L'insertion de Yanae s'effectue en deux étapes :

- Étape 1 : préparation du dispositif. C'est une procédure externe.
- Étape 2 : insertion du DIU Yanae dans la cavité utérine.

#### AVERTISSEMENT

- Ne pas ramasser et utiliser un composant qui est tombé au sol ou sur la table.
- Ne pas vider le contenu du sachet sur le plateau à instruments.

##### ÉTAPE 1 :

#### PRÉPARATION DU DISPOSITIF : CHARGE-MENT DU DIU DANS LE TUBE INSERTEUR

##### 0. Mesure de la longueur de l'utérus

##### 1. Ouverture du sachet

- Placer le sachet sur une surface propre et plane. Pour les droitiers, placer le sachet avec le DIU vers la gauche. Pour les gauchers, placer le sachet avec le DIU vers la droite.
- Ouvrir le sachet à moitié. Ne retirer aucun élément du sachet.

##### 2. Gonflage du ballonnet

Placez le tube de gonflage à la verticale comme illustré sur la Figure 1.

Se munir de la seringue de 3 ml pré-remplie de solution saline contenue dans la boîte.

Figure 1

- Visser la seringue à l'embout, vider entièrement le contenu de la seringue puis pincer le clamp (Figure 2). Le ballonnet va ainsi se remplir de solution saline. Vérifier que le tube de gonflage est distendu.
- Il/elle doit expliquer ses gestes à la patiente en prenant son temps.
- Il/elle doit procéder à un examen manuel ou échographique de l'utérus afin de déterminer la position, la forme, la taille ainsi que l'angle de flexion de l'utérus.
- Avant l'insertion, le vagin et le col de l'utérus doivent être désinfectés à l'aide d'un tampon imbibé de solution antiseptique.
- Le col de l'utérus doit être visualisé au moyen d'un spéculum. La longueur du canal cervical et de la cavité endométriale pourrait être déterminée à l'aide d'une sonde utérine.

##### PRÉPARATION DE LA PATIENTE

- L'opérateur doit porter des gants stériles et suivre une technique aseptique.
- Il/elle doit expliquer ses gestes à la patiente en prenant son temps.
- Il/elle doit procéder à un examen manuel ou échographique de l'utérus afin de déterminer la position, la forme, la taille ainsi que l'angle de flexion de l'utérus.
- Avant l'insertion, le vagin et le col de l'utérus doivent être désinfectés à l'aide d'un tampon imbibé de solution antiseptique.
- Le col de l'utérus doit être visualisé au moyen d'un spéculum. La longueur du canal cervical et de la cavité endométriale pourrait être déterminée à l'aide d'une sonde utérine.
- Devisser la seringue et maintenir le tube de gonflage en position verticale.

#### 3. Chargement du DIU dans l'inserteur

Saisir les fils et tenir fermement le dispositif avec la main gauche (pour les droitiers) ou la main droite (pour les gauchers) au niveau du noeud central et libérer les deux fils. Tirer sur les deux fils afin d'introduire le DIU dans la partie distale de l'inserteur (voir Figure 3).
